

C: Departments

Descriere

Congrats! You've reached the point in your career when you're creating the departments for your new company!

Obviously the first thing you've done was to hire a software engineer and an accountant. However since you don't want to overspend on expensive accounting or administrative software from day 1, you decide to have your software engineer write a simple database program for the accountant to use for tracking each person and the departments they are assigned to. Since the engineer is comfortable with hashtables, he implements one from scratch in C and attempts to use it this as the underlying structure for his database. As any good engineer does, he writes some unit tests to verify the correctness of his code before giving to the accountant to use. The test looks for the frequency of each word and total number of unique words for a given input.

To his surprise, it seems an intern introduced a bug in the program and nothing seems to work despite the fact that everything looks perfect. Can you find the issue and fix it?

Download the sources here:

- [hashtable.c](#)
- [hashtable.h](#)
- [unittest.c](#)

Note

- You may only modify a **single** character!
- The order of the words in the output does not matter.
- **Only** upload hashtable.c

Exemple

Exemplul 1

Intrare

```
foo bar bar bar bar
```

Ieșire

```
foo 1
bar 4
2
```

Exemplul 2

Intrare

```
foo bar bar bar bar random word random test test obi wan kenobi
```

Ieșire

wan 1
random 2
test 2
foo 1
obi 1
bar 4
kenobi 1
word 1
8
